Office Action Summary

Application No.

10/674,568

Applicant(s)

DAVIS ET AL.

Examiner

Ram N. Kackar

Art Unit

1763

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 December 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,3,4,6-18,20,21,23-33 and 35-49 is/are pending in the application.
- 4a) Of the above claim(s) 35-49 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,3,4,6-18,20,21 and 23-33 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Election/Restrictions

1. Applicant's election of claims 1-4, 6-21 and 23-33 in the reply filed on 12/27/05 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. **Claims 1, 3-4, 6-7, 17-18, 20 and 23-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Anthony J. Toprac (US 6379980) in view of John H. Payne (US 5329381) as evidenced by Robert John Wilby (US patent publication 2003/0141572).**

Anthony J. Toprac discloses a method of monitoring an etch process and discloses pre-etch measurement (Fig 3-310 and Fig 1- 100, 120) by pre-etch metrology tool (120) this data is transferred to process controller (150) which monitors the etch process in cooperation with the etching tool (130) and end point monitor (140) which is basically a spectrometer (Col 3 line 32- Col 5 line 9). Anthony J. Toprac further teaches that the etch process monitor allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after

Art Unit: 1763

removal (Col 4 lines 53 to Col 5 line 9). The pre-etch metrology tool disclosed is a commercially available tool using optical ellipsometry or reflectometry (See Robert John Wilby US patent publication 2003/0141572 paragraph 0099).

Toprac however does not disclose the details of the measurement techniques and specially noise elimination for the accuracy of the measurement.

John H. Payne discloses special filter to remove outliers (these are erroneous data points lying outside good data points) and teaches that this is a nonlinear noise-cleaning filter (Col 8 lines 17-24).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used outlier filter to remove noise in order to improve the accuracy of measurement of pre-etch.

Regarding claim 18 mask trim is a regular etch process using reactants known to one of ordinary skill in the art.

Regarding claim 20, the process disclosed above is applicable to photoresist-patterned masks as is well known in the art.

4. Claims 1, 3-4, 6-9, 11-13, 15, 17-18, 20, 23-26, 28-30 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klippert II et al (US 6136712) in view of John H. Payne (US 5329381).

Klippert II et al disclose a method of monitoring an etch process and discloses pre-etch measurement (Col 4 line 64-Col 5 line 1) before starting an etch process which is further monitored by the etch process monitor to allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (abstract). The pre-etch

Art Unit: 1763

metrology tool for thickness measurement and during etching process monitoring is disclosed to be through commercially available metrology systems employing interferometric measurement and monitoring techniques (Col 4 line 45 to Col 5 line 30).

Klippert II et al however do not disclose the details of the measurement techniques and specially noise elimination for the accuracy of the measurement.

John H. Payne discloses special filter to remove outliers (these are erroneous data points lying outside good data points) and teaches that this is a nonlinear noise-cleaning filter (Col 8 lines 17-24).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used outlier filter to remove noise in order to improve the accuracy of measurement of pre-etch.

5. Claims 1, 3-4, 6-9, 11-13, 15, 17-18, 20, 23-26, 28-30 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Petrucci et al (WO 01/24254 A1) in view of John H. Payne (US 5329381)

Petrucci et al disclose a method of monitoring an etch process and discloses pre-etch measurement (Paragraph 18) before starting an etch process which is further monitored by the etch process monitor to allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (abstract). The pre-etch metrology tool for thickness measurement is disclosed to be through preferably a laser system based on ellipsometry (Paragraph 20) and during etching process monitoring employing interferometric measurement and monitoring techniques (Paragraph 5).

Petrucci et al however do not disclose the details of the measurement techniques and specially noise elimination for the accuracy of the measurement.

John H. Payne discloses special filter to remove outliers (these are erroneous data points lying outside good data points) and teaches that this is a nonlinear noise-cleaning filter (Col 8 lines 17-24).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used outlier filter to remove noise in order to improve the accuracy of measurement of pre-etch.

6. Claims 1, 3-4, 6-9, 11-13, 15, 17-18, 20, 23-26, 28-30 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Grimbergen et al (US 6390019) in view of John H. Payne (US 5329381).

Grimbergen et al disclose a method of monitoring an etch process and discloses pre-etch measurement (Col 13 lines 17-25) before starting an etch process which is further monitored by the etch process monitor to allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (abstract). The pre-etch metrology tool for thickness measurement is disclosed to be a commercial system using reflectance thickness measurement system and during etching process monitoring employing interferometric or ellipsometry measurement and monitoring techniques (Col 7 line 60-Col 8 line30).

Grimbergen et al however do not disclose the details of the measurement techniques and specially noise elimination for the accuracy of the measurement.

Art Unit: 1763

John H. Payne discloses special filter to remove outliers (these are erroneous data points lying outside good data points) and teaches that this is a nonlinear noise-cleaning filter (Col 8 lines 17-24).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used outlier filter to remove noise in order to improve the accuracy of measurement of pre-etch.

7. Claims 10, 20 and 27 are rejected under 35 U.S.C. 102(b) as being unpatentable over Anthony J. Toprac (US 6379980) in view of John H. Payne (US 5329381) as applied to claims 1, 3-4, 6-7, 17-18, 20 and 23-24 and further in view of Bin Yu (US 6368982).

Anthony J. Toprac discloses a method of monitoring an etch process in cooperation with the etching tool (130) and end point monitor (140) which is basically a spectrometer (Col 3 line 32- Col 5 line 9). Anthony J. Toprac further teaches that the etch process monitor allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (Col 4 lines 53 to Col 5 line 9).

Anthony J. Toprac does not disclose measurement of features such that horizontal etch and vertical etch accuracy could be validated from measurement of each other.

Bin Yu discloses a method of mask trim and discloses that the mask undergoes etching from all sides and leaves a scaled down length and discloses that the two sides and the top are trimmed by substantially the same trim length (Fig 1 to Fig 3 and Col 1 line 50- Col 2 line 5).

Art Unit: 1763

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used correlation between horizontal etch and vertical etch to validate the accuracy of trim during trim etch.

8. Claims 14 and 31 are rejected under 35 U.S.C. 102(b) as being unpatentable over Klippert II et al (US 6136712) in view of John H. Payne (US 5329381) as applied to claims 1, 3-4, 6-9, 11-13, 15, 17-20, 23-26, 28-30 and 32 and further in view of Nakada et al (JP 11-251252).

Klippert II et al disclose a method of monitoring an etch process and discloses pre-etch measurement (Col 4 line 64-Col 5 line 1) before starting an etch process which is further monitored by the etch process monitor to allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (abstract). The pre-etch metrology tool for thickness measurement and during etching process monitoring is disclosed to be through commercially available metrology systems employing interferometric measurement and monitoring techniques (Col 4 line 45 to Col 5 line 30).

Klippert II et al do not disclose modulation of the intensity of light for measurement.

Nakada et al disclose that light having a desired wavelength and modulation of intensity is used for monitoring a plasma (Abstract).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to use intensity modulation to have better signal/noise ratio as intensity modulation helps to eliminate noise.

Art Unit: 1763

9. Claims 16 and 33 are rejected under 35 U.S.C. 102(b) as being unpatentable over Grimbergen et al (US 6390019) in view of John H. Payne (US 5329381) as applied to claims 1, 3-4, 6-9, 11-13, 15, 17-20, 23-26, 28-30 and 32 and further in view of Grimbergen et al (US 6406924).

Grimbergen et al disclose a method of monitoring an etch process and discloses pre-etch measurement (Col 13 lines 17-25) before starting an etch process which is further monitored by the etch process monitor to allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (abstract). The pre-etch metrology tool for thickness measurement is disclosed to be a commercial system using reflectance thickness measurement system and during etching process monitoring employing interferometric or ellipsometry measurement and monitoring techniques (Col 7 line 60-Col 8 line30).

Grimbergen et al in US 6390019 do not disclose correlation between spectrum minima and width of structures formed during etch. However as the structures are etched the minimas and maxima of the interferometric signal shift since the position of minima and maxima are indicative of etch depth as taught in other patent (US 6406924 – Col 1 line 59-Col 2 line 8).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used correlation between minima and width of etch to validate the accuracy of trim during trim etch.

10. Claim 21 is rejected under 35 U.S.C. 102(b) as being unpatentable over Anthony J. Toprac (US 6379980) in view of John H. Payne (US 5329381) as applied to claims 1, 3-4, 6-7, 17-18, 20 and 23-24 and further in view of Cha et al (US 6319767).

Art Unit: 1763

Anthony J. Toprac discloses a method of monitoring an etch process and discloses pre-etch measurement (Fig 3-310 and Fig 1- 100, 120) by pre-etch metrology tool (120) this data is transferred to process controller (150) which monitors the etch process in cooperation with the etching tool (130) and end point monitor (140) which is basically a spectrometer (Col 3 line 32- Col 5 line 9). Anthony J. Toprac further teaches that the etch process monitor allows etching to a certain end point time to a predetermined depth and monitor for remaining thickness after removal (Col 4 lines 53 to Col 5 line 9). The pre-etch metrology tool disclosed is a commercially available tool using optical ellipsometry or reflectometry (See Robert John Wilby US patent publication 2003/0141572 paragraph 0099).

Anthony J. Toprac does not disclose the mask etch trim process to be a regular plasma etch.

Cha et al disclose that the photoresist mask is reduced by plasma (Col 3 lines 30-35).

Therefore it would have been obvious for one of ordinary skill in the art at the time of invention to have used plasma to reduce photoresist mask produced by lithography to further reduce by plasma for reduction of feature size of layer etched by using the patterned photoresist mask.

Response to Arguments

11. Applicant's arguments filed 12/27/2006 have been fully considered but they are moot in view of new grounds of rejection.

Conclusion

12. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ram N. Kackar whose telephone number is 571 272 1436. The examiner can normally be reached on M-F 8:00 A.M to 5:P.M.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Parviz Hassanzadeh can be reached on 571 272 1435. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
